SCENARIO:

You're building an interactive editorial piece about cities around the world, and want to include a navigation component that will allow the reader to learn about a different city.

Create a simple, minimalist navigation bar based on the video example and use the JSON file provided. Match the design as closely as you can. The navigation bar should have a sliding bar that indicates a selected item, and that bar should resize itself to match the width of the selected item text.

- On `resize`, the sliding indicator bar should update its position and size to match text.
- Code should be optimized for Safari. Support for other browsers is not necessary.
- Please limit library/framework usage (Compilers are permissible but No React/Vue, please).
- ES6 and CSS as much as possible. SASS is permissible.
- You will have 24 hours to complete the exercise.

BONUS:

Display the current time of the selected city. You have creative license on how this should look and behave.
